## 1 Description

This control device selects one of the inputs as output, as determined by the value of the selection control signal.

## 1.1 Pins

This device has four or more signal pins:

<i>pin</i>	<i>description</i>	<i>value when unconnected</i>
in1	input 1	0
in2	input 2	0
...	more inputs	0
sc	selection control	0
out	output	as calculated

## 1.2 Parameters

The following parameters can be specified:

<i>parameters</i>	<i>rules</i>
count of inputs	$2 \leq n \leq 32$
initial selection at $t=0$	

## 1.3 History

No user-defined history is required.

## 1.4 Scopes

Setting the scope flag enables monitoring of the output signal during the simulation.

## 1.5 Output signal interpolation

During the simulation, the output value of the device is calculated at successive instants  $t$  at intervals  $\Delta t$ . Between these simulation instants, the output value can be set to vary in one of two modes, ramped or stepped:

<i>mode</i>	<i>output value between <math>t - \Delta t</math> and <math>t^-</math></i>	<i>value at <math>t^-</math></i>	<i>value at <math>t</math></i>
ramped	interpolated linearly between values $out(t - \Delta t)$ and $out(t^-)$	calculated at $t^-$	calculated at $t$
stepped	remains at $out(t - \Delta t)$	remains at $out(t - \Delta t)$	calculated at $t$

## 2 Time-domain representation

In the time-domain calculation at  $t > 0$ , the output value is calculated as follows:

$$\text{out}(t) = \text{in}_k(t), \text{ where } k = \max(1, \min(n, \text{sc}(t))) \quad (1)$$

## 3 Steady-state representation

In the steady-state calculation at  $t = 0$ , the output value is calculated as follows:

$$\begin{aligned} \text{if } k_0 > 0, & \quad \text{out}(t) = \text{in}_{k_0}(t), \text{ where } k_0 = \text{initial selection index} \\ \text{else} & \quad \text{out}(t) = \text{in}_k(t), \text{ where } k = \max(1, \min(n, \text{sc}(0))) \end{aligned} \quad (2)$$

## 4 Netlist

### 4.1 Format

Netlist format:

```
_c_sel;name;npins;npins;out,sc,list(inputs),  
k0,step/ramp,scope,
```

<i>field</i>	<i>description</i>	<i>value</i>
<code>c_sel</code>	part name	
<code>name</code>	instance name	
<code>npins</code>	pin count	2+count(inputs)
<code>npins</code>	pin count	2+count(inputs)
<code>out</code>	signal name of the output	
<code>sc</code>	signal name of the selection control	
<code>list(inputs)</code>	signal names of the inputs	
<code>k0</code>	selection index at $t=0$	
<code>step/ramp</code>	calculation mode	"S1" for stepped "S0" for ramped
<code>scope</code>	monitoring, optional	"?s" for enabled

The comma separated data is saved into the ParamsA attribute of this device
