## 1 Description

This device is an implementation of the IEEE type AC9C excitation system model. This device is implemented as described in [1]. Implementation details can be viewed by inspecting the subcircuit of this device.

### 1.1 Pins

This device has 14 pins:

Pin name	Type	Description	Units
VREF	Input	Reference voltage of the stator terminal voltage	pu
Efss	Input	Steady-state field voltage at t = 0, for initialization	pu
VC	Input	Terminal voltage of synchronous machine, transducer output	pu
VS	Input	Power System Stabilizer signal	pu
IFD	Input	Field current signal	pu
VT	Input, bundle	Terminal voltage (phasor) of synchronous machine (magnitude and phase)	pu
IT	Input, bundle	Current (phasor) of synchronous machine (magnitude and phase)	pu
VB	Input	Available exciter voltage	pu
VUEL	Input	Under Excitation Limiter signal	pu
VOEL	Input	Over Excitation Limiter signal	pu
VSCL	Input	Stator Current Limiter signal	pu
EFD	Output	Field voltage signal	pu

VF	Output	Excitation system stabilizer signal	pu
VFE	Output	Signal proportional to exciter field current	pu

## 1.2 Parameters

The default set of parameters can be found in [1].

### 1.2.1 Data tab

The parameters on the Data tab are:

1. **Gain  $K_{PR}$ :** voltage regulator proportional gain
2. **Gain  $K_{IR}$ :** voltage regulator integral gain
3. **Gain  $K_{DR}$ :** voltage regulator derivative gain
4. **Time constant  $T_{DR}$ :** lag time constant for derivative channel of PID controller
5. **Maximum regulator output  $V_{PIDmax}$ :** maximum voltage regulator output
6. **Minimum regulator output  $V_{PIDmin}$ :** minimum voltage regulator output
7. **Gain  $K_{PA}$ :** field current regulator proportional gain
8. **Gain  $K_{IA}$ :** field current regulator integral gain
9. **Maximum output  $V_{Amax}$ :** maximum current regulator output
10. **Minimum output  $V_{Amin}$ :** minimum current regulator output
11. **Gain  $K_A$ :** controlled rectifier bridge equivalent gain
12. **Time constant  $T_A$ :** controlled rectifier bridge equivalent time constant
13. **Maximum bridge output  $V_{Rmax}$ :** maximum rectifier bridge output
14. **Minimum bridge output  $V_{Rmin}$ :** minimum rectifier bridge output
15. **Gain  $K_F$ :** exciter field current feedback gain
16. **Time constant  $T_F$ :** field current feedback time constant
17. **Gain  $K_{FW}$ :** free wheel equivalent feedback gain
18. **Maximum feedback  $V_{FWmax}$ :** maximum free wheel feedback
19. **Minimum feedback  $V_{FWmin}$ :** minimum free wheel feedback
20. **Rectifier loading factor  $K_{C1}$ :** rectifier loading factor proportional to commutating reactance
21. **Rectifier loading factor  $K_{C2}$ :** rectifier loading factor proportional to commutating reactance
22. **Gain  $K_P$ :** potential circuit (voltage) gain coefficient
23. **Phase angle Theta<sub>P</sub>:** potential circuit phase angle (degrees)
24. **Gain  $K_{I1}$ :** compound circuit (current) gain coefficient
25. **Gain  $K_{I2}$ :** compound circuit (current) gain coefficient
26. **Reactance  $X_L$ :** reactance associated with potential source
27. **Voltage  $V_{B1max}$ :** maximum available exciter voltage
28. **Voltage  $V_{B2max}$ :** maximum available exciter voltage
29. **Excitation Type option:** see explanations below.
30. **Power Stage Type option:** see explanations below.
31. **Under Excitation Limiter option:** see explanations below.
32. **Over Excitation Limiter option:** see explanations below.
33. **Stator Current Limiter option:** see explanations below.

There are two possible selections for the Excitation Type option:

1. Excitation system is self-excited: VT and IT inputs must be connected.
2. Excitation system comes from a separate source: VB input must be connected

There are two possible selections for the Power Stage Type option:

1. Power Stage is chopper converter.
2. Power Stage is thyristor converter.

There are two possible selections for the Under Excitation Limiter option:

1. VUEL not available or added to the reference voltage: this option can be selected when the VUEL input signal is zero (not connected) or when it is connected and added to the reference voltage.
2. VUEL connected to the high value gate (HV gate)

There are two possible selections for the Over Excitation Limiter option:

1. VOEL not available or added to the reference voltage: this option can be selected when the VOEL input signal is zero (not connected) or when it is connected and added to the reference voltage.
2. VOEL connected to the low value gate (LV gate).

There are three possible selections for the Stator Current Limiter option:

1. VSCL not available or added to the reference voltage: this option can be selected when the VSCL input signal is zero (not connected) or when it is connected and added to the reference voltage.
2. VSCL connected to the high value gate (HV gate).
3. VSCL connected to the low value gate (LV gate).

### 1.2.2 Exciter tab

The parameters on the Data tab are:

1. **Rectifier loading factor  $K_c$** : diode bridge loading factor proportional to commutating reactance
2. **Demagnetizing factor  $K_D$** : demagnetizing factor, function of exciter alternator reactances
3. **Constant  $K_E$** : exciter field proportional constant
4. **Time constant  $T_E$** : exciter field time constant
5. **Minimum output limit  $V_{Emin}$** : minimum exciter output limit
6. **Maximum field current  $V_{FEmax}$** : maximum field current limit
7. **Voltage  $V_{E1}$** : the exciter voltage point which is near the exciter ceiling voltage
8. **Voltage  $V_{E2}$** : the exciter voltage point which is near 75% of  $V_{E1}$
9. **Saturation function output  $SE\_V_{E1}$** : the exciter saturation function value at  $V_{E1}$
10. **Saturation function output  $SE\_V_{E2}$** : the exciter saturation function value at  $V_{E2}$

The exciter saturation function is defined as

$$S_E = A_{EX} e^{B_{EX} E_{FD}} \quad (1)$$

which gives the approximation saturation for any  $E_{FD}$  (exciter output voltage). According to [2] (see pages 562 and 563), the coefficients  $A_{EX}$  and  $B_{EX}$  can be found from:

$$A_{EX} = \frac{S_{V_{E2}}^4}{S_{V_{E1}}^3} \quad (2)$$

$$B_{EX} = \frac{4}{V_{E1}} \ln \left( \frac{S_{V_{E1}}}{S_{V_{E2}}} \right) \quad (3)$$

In the literature [2]  $V_{E1} = V_{E_{max}}$  and  $V_{E2} = V_{E_{0.75max}}$ .

## 2 Initial conditions

The reference voltage VREF can be manually or automatically set by connecting or not connecting the input signal VREF, respectively. When VREF is not connected (the signal is zero), the reference voltage is internally found from the steady-state solution. When VREF is connected, its initial value must match the per unit steady-state voltage of the stator terminal voltage, since otherwise the generator voltage will not start at the actual steady-state.
