

# I sequences, I sequence zero and I sequence positive

I sequences, I sequence zero and I sequence positive ..... 1

1 Description ..... 1

    1.1 Pins for "I sequences" ..... 1

    1.2 Parameters ..... 1

    1.3 Input ..... 2

    1.4 Output ..... 2

## 1 Description

The "I sequence" device calculates the zero, positive, and negative-sequence phasors of the measured 3-phase current. The "I sequence zero" and "I sequence positive" devices can be used for zero and positive sequence only. They constitute a variation of "I sequences" and are provided for convenience only. The following documentation is given only for the most generic device "I sequences".

### 1.1 Pins for "I sequences"

This meter has eight pins:

<i>pin</i>	<i>type</i>	<i>description</i>	<i>units</i>
from	3-phase bus	3-phase "from" bus	
to	3-phase bus	3-phase "to" bus	
mag0	output pin	phasor magnitude of zero sequence current	A
rad0	output pin	phasor angle of zero sequence current	rad
mag1	output pin	phasor magnitude of positive sequence current	A
rad1	output pin	phasor angle of positive sequence current	rad
mag2	output pin	phasor magnitude of negative sequence current	A
rad2	output pin	phasor angle of negative sequence current	rad

### 1.2 Parameters

The following parameter must be defined:

<i>parameter</i>	<i>description</i>	<i>units</i>
freq	fundamental frequency of the probed current	Hz

### **1.3 Input**

The bus pins may be connected in series with any 3-phase power device in a circuit.

### **1.4 Output**

The value of the outputs are the magnitude and angle of the zero-, positive-, and negative-sequence phasors of the first harmonic of the measured 3-phase current. The transformation from 3-phase to sequences is calculated over a sliding time window of period equal to  $1/\text{freq}$ . The phasor magnitudes are the peak amplitude, not the RMS value. The phasor angles are expressed in radians.
