

# Phasor operation : phasor to frame projection

Phasor operation : phasor to frame projection.....	1
1 Description .....	1
1.1 Pins.....	1
1.2 Parameters.....	1
1.3 Input.....	1
1.4 Output.....	1

## 1 Description

This device projects a vector or phasor on a rotated x-y frame. The input vector is represented by a 2-signal bundle of its polar coordinates.

### 1.1 Pins

This device has four pins:

pin	type	description	units
in	2-signal bundle	magnitude	any
		angle	rad
frame_rad	input pin	frame rotation angle	rad
out_x	output pin	x-coordinate	same as in_mag
out_y	output pin	y-coordinate	same as in_mag

### 1.2 Parameters

No parameters are required for this device.

### 1.3 Input

The input pins of the vector may be connected to any 2-signal bundle representing its polar (magnitude,angle) coordinates.

The magnitude is the peak amplitude, not the RMS value. The angle is expressed in radians.

### 1.4 Output

The outputs are the x-axis and y-axis projections of the input vector on a rotated x-y frame.

The operation is immediate, and is calculated as follows:

$$\begin{aligned} \text{proj\_x} &= \text{in\_mag} \cdot \cos(\text{in\_rad} - \text{frame\_rad}) \\ \text{proj\_y} &= \text{in\_mag} \cdot \sin(\text{in\_rad} - \text{frame\_rad}) \end{aligned} \quad (1)$$
