

Phasor operation : polar conjugate multiply

Phasor operation : polar conjugate multiply.....	1
1 Description	1
1.1 Pins.....	1
1.2 Parameters.....	1
1.3 Input.....	1
1.4 Output.....	1

1 Description

This device multiplies two vectors or phasors represented by their polar coordinates. The first vector is multiplied by the conjugate of the second vector.

1.1 Pins

This device has six pins:

<i>pin</i>	<i>type</i>	<i>description</i>	<i>units</i>
in1_mag	input pin	input-1 magnitude	any
in1_rad	input pin	input-1 angle	rad
in2_mag	input pin	input-2 magnitude	any
in2_rad	input pin	input-2 angle	rad
out_mag	output pin	output magnitude	units(in1_mag)*units(in2_mag)
out_rad	output pin	output angle	rad

1.2 Parameters

No parameters are required for this device.

1.3 Input

The input pins may be connected to any control signals.

1.4 Output

The outputs are the polar coordinates of the product of the first input vector by the conjugate of the second vector.

The operation is immediate, and is calculated as follows:

$$\begin{aligned} \text{out_mag} &= \text{in1_mag} \cdot \text{in2_mag} \\ \text{out_rad} &= \text{in1_rad} - \text{in2_rad} \end{aligned} \quad (1)$$
