

# Phasor operation : polar multiply

Phasor operation : polar multiply .....	1
1 Description .....	1
1.1 Pins.....	1
1.2 Parameters.....	1
1.3 Input.....	1
1.4 Output.....	1

## 1 Description

This device multiplies two vectors or phasors represented by their polar coordinates.

### 1.1 Pins

This device has six pins:

<i>pin</i>	<i>type</i>	<i>description</i>	<i>units</i>
in1_mag	input pin	input-1 magnitude	any
in1_rad	input pin	input-1 angle	rad
in2_mag	input pin	input-2 magnitude	any
in2_rad	input pin	input-2 angle	rad
out_mag	output pin	output magnitude	units(in1_mag)*units(in2_mag)
out_rad	output pin	output angle	rad

### 1.2 Parameters

No parameters are required for this device.

### 1.3 Input

The input pins may be connected to any control signals.

### 1.4 Output

The outputs are the polar coordinates of the product of the two input vectors.

The operation is immediate, and is calculated as follows:

$$\begin{aligned} \text{out\_mag} &= \text{in1\_mag} \cdot \text{in2\_mag} \\ \text{out\_rad} &= \text{in1\_rad} + \text{in2\_rad} \end{aligned} \quad (1)$$
